## DEVELOPED BY KEV

The difference a substrate makes to the quality of a finished project is something plastering professionals understand all too well. It takes a pro to know how tricky some surfaces can be.

Kev the plasterer understood this better than anyone, because he'd plastered his way round the world; from Thailand, to New Zealand, to Las Vegas.

Back on home soil Kev was plastering the walls of the rundown tower block, which were a bewildering patchwork of different substrates, including existing plaster, well-adhered old paints and wallpaper adhesive residues.

This gave various degrees of absorption, leading to newly applied plaster drying at different rates, which can cause cracking.

There had to be a better way of providing a more uniform key for the plaster, so Kev stopped skimming and started thinking.

After months of experimenting in his garage and on site, he came up with the perfect solution.

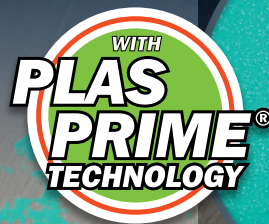

## PLASTERER APPROVED PERFORMANCE

Specially developed for the plastering professional, Plasterer's Stabilising Primer primes and stabilises most interior surfaces before applying new plaster. It gives excellent adhesion, meaning plasterers can plaster faster!

The patented Plasprime technology contains recycled plastic, which is great for everyone and provides an excellent key for re-skimming.

## DOESN'T CONTAIN SAND

Unlike other products on the market Plasterer's Primer doesn't contain any sand, which:

- Absorbs moisture from the plaster, causing cracking
- Gives a patchy and uneven key
- Causes mess by flying off the brush when applying
- Drags through the plaster leaving lines
- Sinks to the bottom of the tub meaning continuous mixing
